

Private Equity Deal Team — Mental Model

Three core workflows: Customer Analysis · Financial Modelling · IC Documentation

WORKFLOW 1

Customer Data Analysis

Job to be done: Pressure-test revenue durability & cash-flow predictability

Who

Associates + VPs · Diligence phase (4–6 wks)

Shape

Iterative — pull, clean, analyse, recut. Very spreadsheet-heavy.

WORKFLOW 2

Financial Modelling & Valuation

Job to be done: Determine max entry price & debt capacity to hit the return hurdle

Who

Analysts + Associates build · VPs review & stress-test

Shape

Non-linear, highly iterative — model updates as diligence sharpens assumptions.

01

3-Statement Model

Linked P&L / BS / CF

WORKFLOW 3

IC Slide Generation

Job to be done: Synthesise all diligence into a compelling go / no-go recommendation for IC

Who

VP / Principal authors · MD / Partner reviews

Shape

Linear assembly, highly collaborative — many contributors, many revision rounds.

01

Investment Thesis

How each workflow feeds the next

Outputs become inputs downstream — and late findings loop back upstream.

KEY UX INSIGHT This is not a linear pipeline. IC pushback (WF3) reopens the model (WF2), and new data in WF2 can invalidate the revenue build (WF1) — loops happen constantly.

The question behind each workflow

What deal-team members are really trying to answer — and where it hurts.

CUSTOMER ANALYSIS "Is this revenue real and durable?" APPROACH Like a prosecutor: assume the revenue is fake until they can prove otherwise. KEY ANXIETY Is churn accelerating? Is the top customer leaving? Are margins real per segment? DECISION GATE $\text{NRR} > 100\%$? $\text{LTV} / \text{CAC} > 3\times$? If yes, the revenue thesis holds. If not, reprice or walk. BIGGEST PAIN Data is never clean. Getting customer data from target CFOs takes days; shaping it into usable cohorts takes more.	FINANCIAL MODELLING "What price can I pay and still hit my return hurdle?" APPROACH Work backwards from a target IRR (typically 20–25%+) and solve for the maximum justifiable entry multiple. A LIVING DOCUMENT Every diligence finding — customer churn, margin normalisation — flows back into the model. KEY ANXIETY Am I buying at peak margins? Is EBITDA normalised correctly? Will covenants hold in the downside? BIGGEST PAIN Managing model versions across a team, linking assumptions across tabs, and rebuilding mid-diligence when numbers restate.	IC DOCUMENTATION "Can I get the IC to say yes?" APPROACH Audience-first: what will the IC ask, and which risks will they push back on hardest? POLITICS The thesis slide is the most political — partners debate framing, word choice and narrative angle. WHAT IC CARES ABOUT The deck runs 30–60 pages, but the IC only cares about the thesis, key risks and the return scenario. BIGGEST PAIN Last-mile assembly — stitching Excel charts into PowerPoint, version chaos, and constant late-stage number updates.
